

Environmental:

When Waste is diverted we save both the landfill impacts and the impacts of producing a new product. How can we connect this to what we are selling?
(Upstream and downstream savings)

Waste upcycled is the best/highest use. How can we differentiate between items that were upcycled and items that were resold without modification?

How much landfill space and subsequent cost are we saving the city or others?

How can we be a hub for breaking down societal norms, right to repair, and consumerism?
(Tool library and repair cafe?)

Community/ Social:

CCRX is about more than diverting waste; it is about people. How can we share the number of people we reach and their stories? (Create some sort of web of connections to visualize?)

CCRX has been particularly helpful to teachers in the Chicagoland area. How can we best tell this story? Can we categorize teachers reached and what they do so we can connect this with larger social issues in the city? For example are we seeing more Arts teachers coming in after we see cuts to Arts funding in CPS? If we can connect these two I think this shows how important CCRX is for keeping these vital programs working.

What percentage of sales are to local customers? What percentage of sales are online? Are specific items more likely to sell online than in person?

Other:

What comparisons can we make to other similarly sized organizations?

What gaps are we filling in the community that the city or other organizations are failing to provide?

Any other ways of visualizing the data we already have?

How can we measure the impact of classes?

What insights can we get from teacher data?

What percentage is teachers? What percentage is walk-ins or other artists? How can we better clarify who we are serving?
